Individual or Stand Alone Leaks Must be Pre-Approved by Program Administrator

Proper Documentation including Photos are Required

Internal oil seals/gaskets leaking which cause either the need for regular topping up of lubricant between regular service intervals, or a sudden escape of lubricant, may be covered. Internal oil seals/gaskets are oil seals/gaskets which are internal to the machine and do not have a face to the outside air. External oil seals/gaskets that has oil escaping from an eligible reservoir, sump, housing or gearbox, where the correct level cannot be maintained to ensure proper operation, has developed a drip/run that reaches the ground, will damage surrounding components, or puddle in/on the machine, may be covered so long as the leak is an internal seal/gasket failure and cannot be attributed to wear or contamination. External oil seals/gaskets have an external face and are susceptible to wear and contamination damage. External oil seals/gaskets leaking but not requiring regular topping up of lubricant between regular service intervals, and which are found at service inspection, and have not been previously reported as a fault by the client, are not covered.
